# New CI-V Commands for External Antenna Controller and Logging Software

## Antenna Control Commands

When you change operating frequency, mode and filter settings, the antenna controller command automatically outputs the current status via the remote jack (CI-V). Commands can be used with an external antenna controller to control a multi-band antenna.

\* Compatible 3rd party external antenna controller required.

## Logging Software Commands

Commands are added to record the transceiver's Main and Sub (or VFO A and VFO B) frequencies, modes and filter and data settings in Dualwatch or Split operation. These commands can be used via the remote jack (CI-V) or USB connector for logging operation.

\* Compatible 3rd party logging software required.

## Other Features

- RIT and  $\Delta$ TX setting commands
- CS-7100 programming software is updated

For existing owners, the latest firmware and CS-7100 software can be download free from:

<http://www.icom.co.jp/world/support/index.html>
